A Virtual Keyboard for your PSP (Dvorak Layout)

Hi All,

I've made a new version of the javascript keyboard, using Dvorak Layout
(for those who don't know who Dvorak is, i suggest you to go there : [dvorak keyboard layout](#))

Here is a demo :
[psp web keyboard](#)

It is very usefull for me to make google search, or to enter URL in a more friendly manner

You can unzip the archive on your memory stick and then add a bookmark to the location such as
[file:/psp/dvorak/index.html](#)

Here is the zip file : [dvorak.zip](#)

Enjoy !

Zx.

PS: For those who prefer Qwerty layout, here is the zip file : [qwerty.zip](#)

Excellent work, keep it up

Cheers, Zx

I must be doing something really silly! I have stored the html file for the qwerty keyboard in my memory stick. I can link to the file and the keyboard displays properly on my PSP screen. I assume that at this point I would simply highlight an appropriate letter or digit with the arrow keys followed by the 'X' key and the letter/digit/sign would display on the address bar provided. Unfortunately nothing happens, nothing shows up on the address space! What am I doing wrong? Thank you very much for your help.
